

# PETROMYZON

DD/Paper 3rd/Gr A

## STRUCTURE & AFFINITIES

Petromyzon commonly known as lamprey, are found all over the world. It is marine as well as fresh water forms. It is ectoparasite of fishes.

### External feature:

- (I) Body is elongated, cylindrical and eel like. *P. marinus* is about 1 meter long.
- (II) The body is dark dorsally while on the lateral and ventral side it is silvery and whitish.
- (III) The skin is slimy and scaleless.
- (IV) The body is divided into three parts - Head, <sup>trunk & tail</sup> trunk
- (V) The head is cylindrical and has a buccal funnel, a mouth, a single nares, a pair of eyes and seven pairs of gill slits.
- (VI) Mouth is antero-ventral and surrounded by cup-like funnel.
- (VII) The buccal funnel is cuplike structure situated at the anterior end of the head. It is directed downward. It functions as a sucker and is provided with oral papillae or oral fimbriae.
- (VIII) The inner surface of buccal funnel is provided with radiating rows of conical, horny teeth. The centre of the buccal funnel has a circular mouth.
- (IX) A tongue produce through the mouth. It is also provided with teeth acting as a rasping organ.
- (X) The nares is present on the dorsal surface of the head. It leads into olfactory sac. The olfactory sac is organ of smell. Behind eye, laterally are 7 pair of gill apertures.

### The trunk:

- (i) The trunk is cylindrical, it has two median dorsal fins.
- (ii) The fins are supported by cartilaginous rods called fin rays.
- (iii) At the junction of trunk and tail, the anus and urogenital aperture are present on <sup>the</sup> ventral side.

### The tail:

- (i) The tail is laterally compressed. It has a caudal or tail fin. The tail fin is also supported by fin rays.

### Digestive system:

- (i) The mouth is absent. The tongue in the buccal funnel leads into buccal cavity. The buccal cavity passes behind into two tubes - the dorsal oesophagus and ventral pharynx or respiratory tubes. Guarded by velum.
- (ii) Stomach is absent. The intestine is straight and provided with spiral valve. The gall bladder and bile duct degenerate in adult.

### Respiratory system:

- (i) It consists of six pairs of gill pouches each open separately <sup>to the</sup> exterior by short passage. Internally they open into ventral pharynx.
- (ii) Respiratory movement takes place by branchial basket.

Branchial basket is placed superficially below the skin. It is composed of nine irregular, vertical bars of cartilage. The first is immediate posterior to styloid cartilage. These are connected together by four longitudinal bars, one dorsally, one ventrally and two laterally.

### Endoskeleton:

- (i) The skull is primitive and cartilaginous.
- (ii) Its floor is composed of parachordal & trabeculae. Collective constitute basal plate.
- (iii) Anterior to basal plate is a large aperture basi-crural fontanelle.
- (iv) A pair of auditory capsule linked with the posterior end of the basal plate.
- (v) Each side of basal plate is sub-ocular arch supporting the eye.
- (vi) Additional cartilage such as dorsal plate, lateral cartilages, ~~styloid~~ cartilage are present in skull.
